

- Given a structure those Entities
  - Ticket (Id, Description, Title)
  - Department (Id, Name)
  - Developer (Id, Name)
- With Relations:
  - 1 Department with Many Tickets
  - Many Tickets with Many Developers
- Using N-Tier Architecture, build simple crud operations on Tickets.
- Create an endpoint to return a Department by id with its tickets and display the number of developers associated with each ticket.
- 
- The response should be something like this:

```

{
  "Id": 1,
  "Name": "Web App Development Department",
  "Tickets": [
    {
      "Id": 10,
      "Description": "Very cool ticket",
      "DevelopersCount": 10
    },
    {
      "Id": 20,
      "Description": "weird bug",
      "DevelopersCount": 5
    }
  ]
}

```

- Create an endpoint to edit the ticket with the Developers.
