

- Use ASP.Identity to handle Identity.
- Create a controller for handling (Login/ Register)
- Create a custom entity that inherits from IdentityUser with any **custom property**.
- Create two register endpoints
 - One to register as admin (Claim(Role) => admin)
 - One to register as user (Claim(Role) => user)
- Add DataController that will have the following endpoint:
 - GetUserInfo which will return:
 - Can be accessible by any authenticated user
 - The current user's UserName
 - The current user's Email
 - The current user's **custom property**.
 - GetInfoForManager:
 - Can be accessible only by Users who have "claim" admin.
 - Return any data.
 - GetInfoForUser:
 - Can be accessible only by Users who have "claim" admin or user.
 - Return any data.
